St. Luke's Clinic — Outpatient Progress Note

Patient: 57 y/o male · Provider: Dr. Alvarez · Visit: routine follow-up

---

Subjective

Patient returns for ongoing management. Over the past several months he reports increasing fatigue and notes that his urine has appeared unusually **foamy**. He has also noticed mild **puffiness around the eyes** in the mornings and some **swelling in both ankles** by the end of the day. He is waking twice nightly to urinate.

Objective

Blood pressure remains **difficult to control** at 152/94 despite three antihypertensive agents. A recent metabolic panel shows his **serum creatinine has drifted up** from 1.0 to 1.4 over the past year. **Urine dipstick is positive for protein** on two consecutive visits. Weight up 4 lbs from fluid.

Assessment / Plan

Poorly controlled hypertension with new lower-extremity edema and proteinuria. Will order a urine protein-to-creatinine ratio, add a fourth agent, counsel on sodium restriction, and recheck labs in 6–8 weeks.
